Bios 6301: Assignment 5

Valerie Welty

Due Tuesday, 15 November, 1:00 PM

$5^{n=day}$ points taken off for each day late.

50 points total.

Submit a single knitr file (named `homework5.rmd`), along with a valid PDF output file. Inside the file, clearly indicate which parts of your responses go with which problems (you may use the original homework document as a template). Add your name as `author` to the file's metadata section. Raw R code/output or word processor files are not acceptable.

Failure to name file `homework5.rmd` or include author name may result in 5 points taken off.

Question 1

24 points

Import the HAART dataset (`haart.csv`) from the GitHub repository into R, and perform the following manipulations: (4 points each)

```
haart <- read.csv("https://raw.githubusercontent.com/fonnesbeck/Bios6301/master/datasets/haart.csv",
    stringsAsFactors = FALSE)

####### 1. Convert date columns into a usable (for analysis) format.  Use the
####### `table` command to display the counts of the year from `init.date`.

library(lubridate)
```

```
## Warning: package 'lubridate' was built under R version 3.2.5
```

```
##
## Attaching package: 'lubridate'
```

```
## The following object is masked from 'package:base':
##
##     date
```

```
haart[, "init.date"] <- mdy(haart[, "init.date"])
haart[, "last.visit"] <- mdy(haart[, "last.visit"])
haart[, "date.death"] <- mdy(haart[, "date.death"])

years <- substr(haart[, "init.date"], 1, 4)
table(years)
```

```
## years
## 1998 2000 2001 2002 2003 2004 2005 2006 2007
##    1    5   17   60  270  292  207  104   44
```

```
####### 2. Create an indicator variable (one which takes the values 0 or 1 only)
####### to represent death within 1 year of the initial visit.  How many
####### observations died in year 1?

haart[, "death.1yr"] <- 0
ind <- which(haart[, "death"] == 1)
time <- as.numeric(haart[ind, "date.death"] - haart[ind, "init.date"])
temp <- data.frame(ind, time)
haart[temp[, "ind"], "death.1yr"] <- as.numeric(temp[, "time"] <= 365)

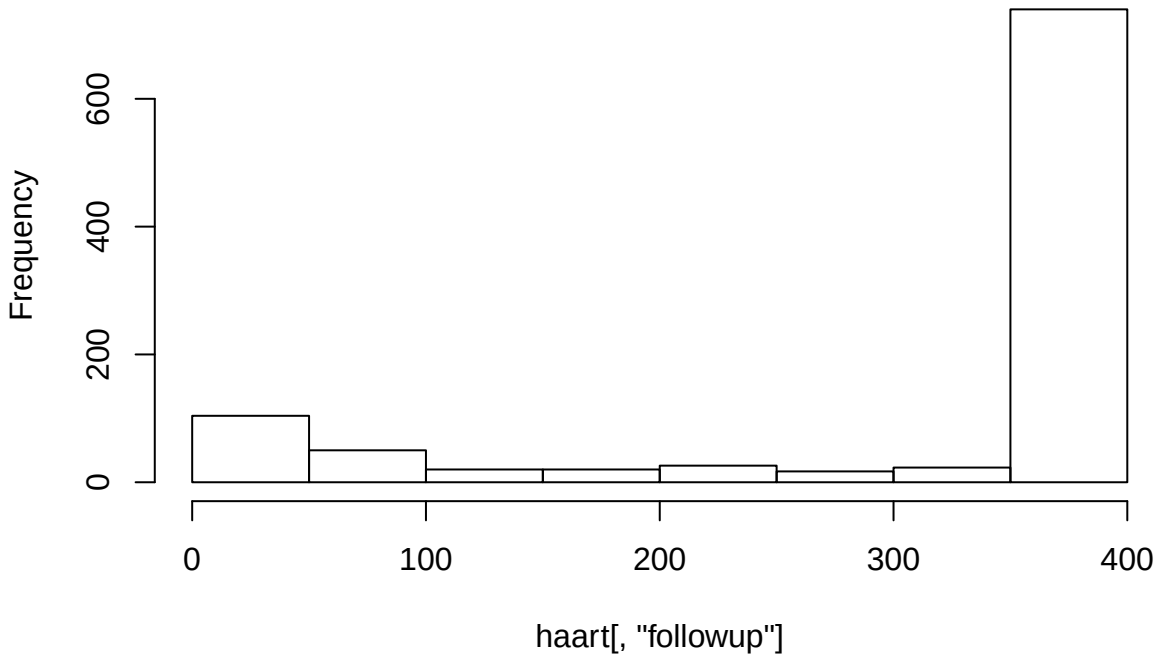
length(which(haart[, "death.1yr"] == 1))
```

```
## [1] 92
```

```
##### 3. Use the `init.date`, `last.visit` and `death.date` columns to calculate
##### a followup time (in days), which is the difference between the first and
##### either the last visit or a death event (whichever comes first). If these
##### times are longer than 1 year, censor them (this means if the value is
##### above 365, set followup to 365).  Print the quantile for this new
##### variable.

haart[ind, "followup"] <- temp[, "time"]
ind.2 <- which(haart[, "death"] == 0)
time.2 <- as.numeric(haart[ind.2, "last.visit"] - haart[ind.2, "init.date"])
temp.2 <- data.frame(ind.2, time.2)
haart[ind.2, "followup"] <- temp.2[, "time.2"]
# hist(haart[,'followup']) quantile(haart[,'followup'])

for (i in 1:nrow(haart)) {
    if (haart[i, "followup"] >= 365) {
        haart[i, "followup"] = 365
    }
}
hist(haart[, "followup"])
```



```
quantile(haart[, "followup"])
```

```
##    0%   25%   50%   75%  100%
##   0.0 329.5 365.0 365.0 365.0
```

```
##### 4. Create another indicator variable representing loss to followup; this
##### means the observation is not known to be dead but does not have any
##### followup visits after the first year.  How many records are
##### lost-to-followup?

for (i in 1:nrow(haart)) {
    if (haart[i, "followup"] < 365 & haart[i, "death"] == 0) {
        haart[i, "lossfu"] = 1
    } else {
        haart[i, "lossfu"] = 0
    }
}
length(which(haart[, "lossfu"] == 1))
```

```
## [1] 173
```

```
###### 5. Recall our work in class, which separated the `init.reg` field into a
###### set of indicator variables, one for each unique drug. Create these fields
###### and append them to the database as new columns.  Which drug regimen are
###### found over 100 times?

all.reg <- unique(unlist(strsplit(haart[, "init.reg"], ",")))
all.reg
```

```
##  [1] "3TC" "AZT" "EFV" "NVP" "D4T" "ABC" "DDI" "IDV" "LPV" "RTV" "SQV"
## [12] "FTC" "TDF" "DDC" "NFV" "T20" "ATV" "FPV"
```

```
haart[, all.reg] <- 0

for (i in 1:nrow(haart)) {
    reg <- unlist(strsplit(haart[i, "init.reg"], ","))
    haart[i, reg] <- 1
}

regimen <- haart[, "init.reg"]
z <- as.data.frame(table(regimen))
z[which(z[, "Freq"] > 100), ]
```

```
##        regimen Freq
## 10 3TC,AZT,EFV  421
## 17 3TC,AZT,NVP  284
```

6. The dataset `haart2.csv` contains a few additional observations for the same study. Import these and append them to your master dataset (if you were smart about how you coded the previous steps, cleaning the additional observations should be easy!). Show the first five records and the last five records of the complete (and clean) data set.

```
haart2 <- read.csv("https://raw.githubusercontent.com/fonnesbeck/Bios6301/master/datasets/haart2.csv",
    stringsAsFactors = FALSE)

haart2[, "init.date"] <- mdy(haart2[, "init.date"])
haart2[, "last.visit"] <- mdy(haart2[, "last.visit"])
haart2[, "date.death"] <- mdy(haart2[, "date.death"])
```

```
## Warning: All formats failed to parse. No formats found.
```

```
haart2[, "death.1yr"] <- 0
ind <- which(haart2[, "death"] == 1)
time <- as.numeric(haart2[ind, "date.death"] - haart2[ind, "init.date"])

Question 2

14 points

Use the following code to generate data for patients with repeated measures of A1C (a test for levels of blood glucose).

```
genData <- function(n) {
    if (exists(".Random.seed", envir = .GlobalEnv)) {
        save.seed <- get(".Random.seed", envir = .GlobalEnv)
        on.exit(assign(".Random.seed", save.seed, envir = .GlobalEnv))
    } else {
        on.exit(rm(".Random.seed", envir = .GlobalEnv))
    }
    set.seed(n)
    subj <- ceiling(n/10)
    id <- sample(subj, n, replace = TRUE)
    times <- as.integer(difftime(as.POSIXct("2005-01-01"), as.POSIXct("2000-01-01"),
        units = "secs"))
    dt <- as.POSIXct(sample(times, n), origin = "2000-01-01")
    mu <- runif(subj, 4, 10)
    a1c <- unsplit(mapply(rnorm, tabulate(id), mu, SIMPLIFY = FALSE), id)
    data.frame(id, dt, a1c)
}
```

Perform the following manipulations: (2 points each)

```
##### 1. Order the data set by `id` and `dt`.

x <- genData(500)
x <- x[order(x[, "id"], x[, "dt"]), ]

##### 2. For each `id`, determine if there is more than a one year gap in
##### between observations.  Add a new row at the one year mark, with the `a1c`
##### value set to missing.  A two year gap would require two new rows, and so
##### forth.
```

```
numobs <- nrow(x)

date1 <- x[1, "dt"]
curr.id <- x[1, "id"]

for (i in 2:nrow(x)) {
    if (x[i, "id"] != curr.id) {
        date1 = x[i, "dt"]
        curr.id <- x[i, "id"]
    } else {

        date2 <- x[i, "dt"]
        date2
        timegap <- as.numeric(date2 - date1)
        if (timegap > 365 & timegap <= 730) {
            missing <- as.Date(date1, format = "%Y-%m-%d") + 365
            x[numobs + 1, "dt"] = missing
            x[numobs + 1, "id"] = curr.id
            x[numobs + 1, "a1c"] = "."
            numobs = numobs + 1
        } else if (timegap > 730) {
            missing <- as.Date(date1, format = "%Y-%m-%d") + 365
            x[numobs + 1, "dt"] = missing
            x[numobs + 1, "id"] = curr.id
            x[numobs + 1, "a1c"] = "."
            missing2 <- as.Date(date1, format = "%Y-%m-%d") + 730
            x[numobs + 2, "dt"] = missing2
            x[numobs + 2, "id"] = curr.id
            x[numobs + 2, "a1c"] = "."
            numobs = numobs + 2
        }
        date1 = date2

    }
}

x <- x[order(x[, "id"], x[, "dt"]), ]

##### 3. Create a new column `visit`.  For each `id`, add the visit number.
##### This should be 1 to `n` where `n` is the number of observations for an
##### individual.  This should include the observations created with missing a1c
##### values.

curr.id <- x[1, "id"]
n = 1

for (i in 1:nrow(x)) {
    if (x[i, "id"] == curr.id) {
        x[i, "visit"] = n
        n = n + 1
    } else if (x[i, "id"] != curr.id) {

Question 3

10 points

Import the `addr.txt` file from the GitHub repository. This file contains a listing of names and addresses (thanks google). Parse each line to create a data.frame with the following columns: lastname, firstname, streetno, streetname, city, state, zip. Keep middle initials or abbreviated names in the firstname column. Print out the entire data.frame.

```
addr <- read.csv("https://raw.githubusercontent.com/fonnesbeck/Bios6301/master/datasets/addr.txt",
    stringsAsFactors = FALSE)
col <- c("lastname", "firstname", "streetno", "streetname", "city", "state",
    "zip")
for (i in 1:length(col)) {
    addr[, col[i]] <- character(nrow(addr))
}

for (i in 1:nrow(addr)) {
    x.temp <- unlist(strsplit(addr[i, 1], "  "))
    x <- x.temp[x.temp != ""]
    addr[i, "lastname"] = x[1]
    addr[i, "firstname"] = x[2]
    addr[i, "streetno"] = gsub("([0-9]{1,4}).*", "\\1", x[3])
    addr[i, "streetname"] = gsub("[0-9]{1,4} (.*)", "\\1", x[3])
    addr[i, "city"] = x[4]
    addr[i, "state"] = x[5]
    addr[i, "zip"] = x[6]
}
```

```
addr[, "zip"] = gsub("O", "0", addr[, "zip"])
addr[, 1] = NULL

addr
```

```

Question 4

2 points

The first argument to most functions that fit linear models are formulas. The following example defines the response variable `death` and allows the model to incorporate all other variables as terms. `.` is used to mean all columns not otherwise in the formula.

```
url <- "https://github.com/fonnesbeck/Bios6301/raw/master/datasets/haart.csv"
haart_df <- read.csv(url)[, c("death", "weight", "hemoglobin", "cd4baseline")]
coef(summary(glm(death ~ ., data = haart_df, family = binomial(logit))))
```

```
##                 Estimate  Std. Error   z value     Pr(>|z|)
## (Intercept)  3.576411744 1.226870535  2.915069 0.0035561039
## weight      -0.046210552 0.022556001 -2.048703 0.0404911395
## hemoglobin  -0.350642786 0.105064078 -3.337418 0.0008456055
## cd4baseline  0.002092582 0.001811959  1.154872 0.2481427160
```

Now imagine running the above several times, but with a different response and data set each time. Here's a function:

```
myfun <- function(dat, response) {
    form <- as.formula(response ~ .)
    coef(summary(glm(form, data = dat, family = binomial(logit))))
}
```

Unfortunately, it doesn't work. `tryCatch` is "catching" the error so that this file can be knit to PDF.

```
tryCatch(myfun(haart_df, death), error = function(e) e)
```

```
## <simpleError in eval(expr, envir, enclos): object 'death' not found>
```

What do you think is going on? Consider using `debug` to trace the problem.

```
debug(myfun)
myfun(haart_df, death)
undebug(myfun)
```

The error is: 'object 'death' not found'

I believe that the issue is that we are trying to pass into the function something which is to be used as a string, but the function is expecting it to be a variable.

5 bonus points

Create a working function.

```
myfun3 <- function(dat, response) {
    form <- paste("as.formula(", response, "~ .)")
    coef(summary(glm(form, data = dat, family = binomial(logit))))
}
myfun3(haart_df, "death")
```

```
##                 Estimate  Std. Error   z value     Pr(>|z|)
